

3. Project Design Phase

Architecture & ACL Evaluation Matrix

1. ACL Execution Overview

When a user opens `u_institution_details.list`, ServiceNow triggers the Read ACL. The ACL checks elevated security privileges, validates user role `bb1`, checks if `Branch == EEE`, and executes the server-side script.

2. CRUD Permissions Matrix

Operation	Target Table	Role Required	Condition / Script	Action Output
READ	u_institution_details	bb1	Branch is EEE + Script	Displays EEE records only
CREATE	u_institution_details	bb2	None	Enables "New" button
WRITE	u_institution_details	bb3	None	Enables field editing
DELETE	u_institution_details	bb4	None	Enables "Delete" action
